1. Introduction

This report documents my personal portfolio website, a responsive single-page site that presents my profile, skills, education, projects and contact details. It is built entirely with hand-written HTML5 and CSS3, with no frameworks or templates, and uses a soft watercolor theme in white, blush pink and lilac.

2. Objective

The objective of this task was to design and develop a professional, fully responsive portfolio website that showcases my work clearly and makes it easy for visitors to get in touch.

- Create a distinctive visual identity with a clean, organised layout.
- Deliver a responsive experience across desktop and mobile screens.
- Showcase real projects with screenshots, technology tags and GitHub links.

3. Technologies Used

The website is fully static, so no build step or external dependencies are required. The following technologies were used in its development:

Technology	Purpose
HTML5	Semantic page structure, forms, media and accessibility attributes
CSS3	Custom design system, Flexbox and Grid layouts, animations and media queries
SVG	Hand-crafted watercolor decoration filters and inline icons

3.1 Tools and Environment

- Editor: Visual Studio Code, with Git and GitHub for version control.
- Hosting / running: opens directly in any modern browser (Chrome, Edge, Firefox, Safari) or through a simple local static server such as python -m http.server 8000.
- Helper tools: an image-generation PowerShell script and a mobile screenshot helper page, stored in the tools/ folder.

4. Website Structure

The site is a single-page layout. A sticky navigation bar links to each section, and the page flows from the hero through to the footer in the following order:

Section	Navigation Focus
Home / Hero	Intro, tagline, buttons
About	Introduction and tech icons
Skills	Skill cards and meters
Education	Academic timeline
Projects	Three project cards
Contact	Details, form, links
Footer	Links and socials

5. Design Approach

The visual identity is built around a soft watercolor theme: a white canvas with flowing pink and lilac washes, elegant serif headings and smooth micro-animations that feel polished without being distracting. The aim was a design that looks creative and personal while staying clean and easy to read.

5.1 Design Principles

- **Typography:** Playfair Display serif headings paired with Inter body text for a refined, readable hierarchy, with a system-font fallback.
- **Watercolor decoration:** hand-crafted SVG blobs and filters create soft pink and lilac washes in the hero and section backgrounds.
- **Gradient accents:** a rose-to-lilac gradient is used on primary buttons, date badges and icon tiles to tie the interface together.
- **Card-based layout:** rounded white cards with subtle shadows organise skills, education, projects and contact details consistently.
- **Responsive layout:** Flexbox and Grid with media queries so the layout adapts from wide desktop screens to mobile.

6. Website Features

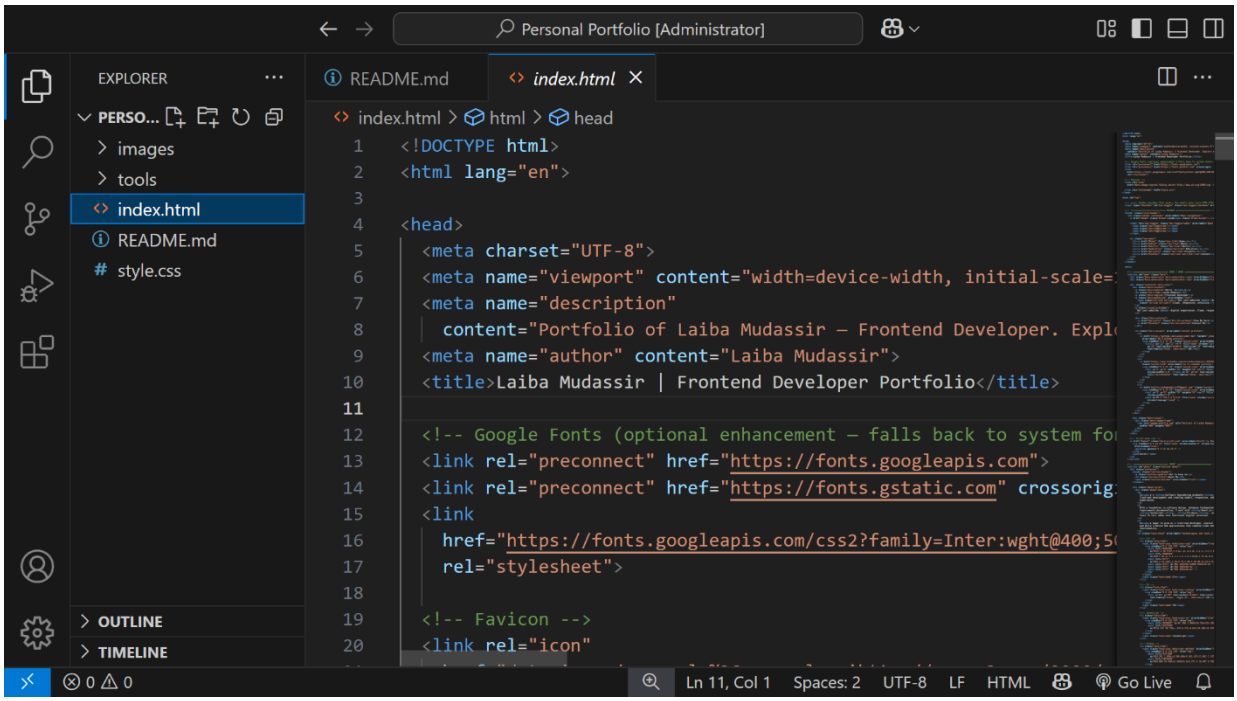

The main features of the website are summarized in the table below:

Feature	Description
Home	Name, "Frontend Developer" title, animated typewriter punch line, profile badge and call-to-action buttons.
About	A three-paragraph introduction with a strip of ten tech-stack icons.
Skills	Eight skill cards with SVG icons, percentages and animated progress meters.
Education	A timeline of three qualifications, each with a date badge and short description.
Projects	Three project cards with screenshots, technology tags and GitHub links.
Contact	Email, phone and location cards, a styled contact form and social link buttons.
Footer	Short bio, quick navigation links, social icons and copyright line.

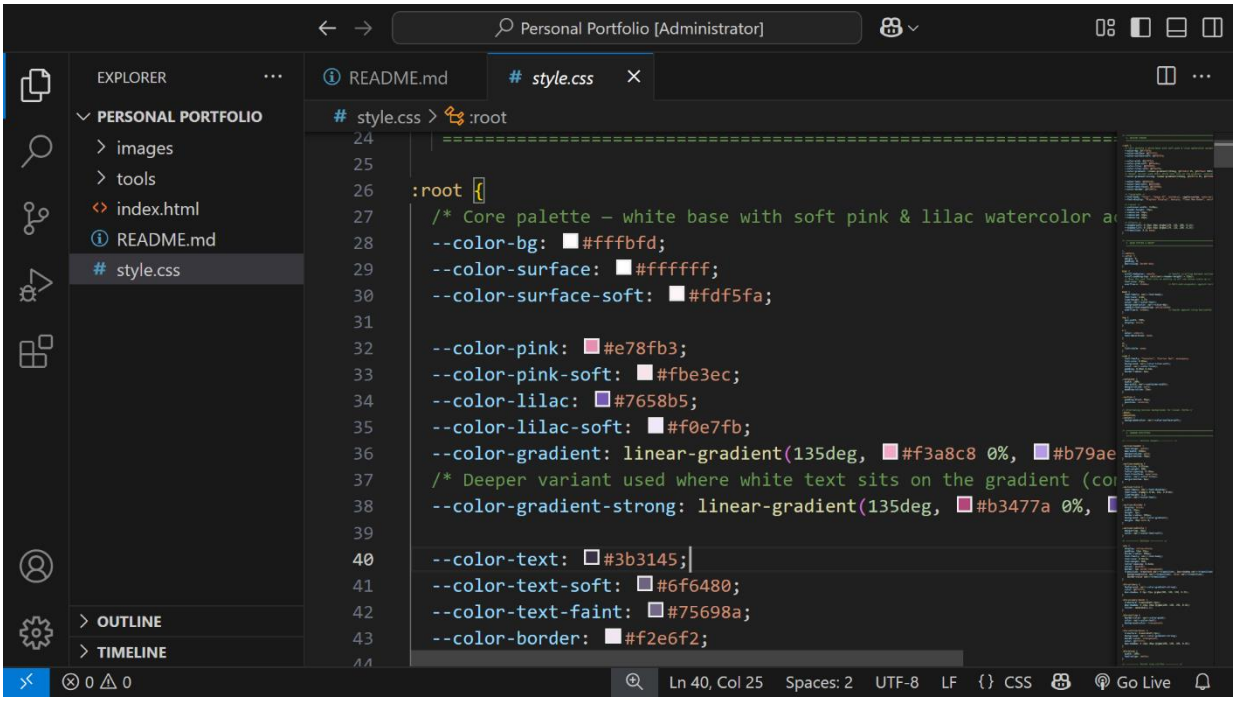

7. Code Screenshots

The following frames show the key parts of the source code that power the website: the semantic HTML structure, the CSS design system.

Index.html

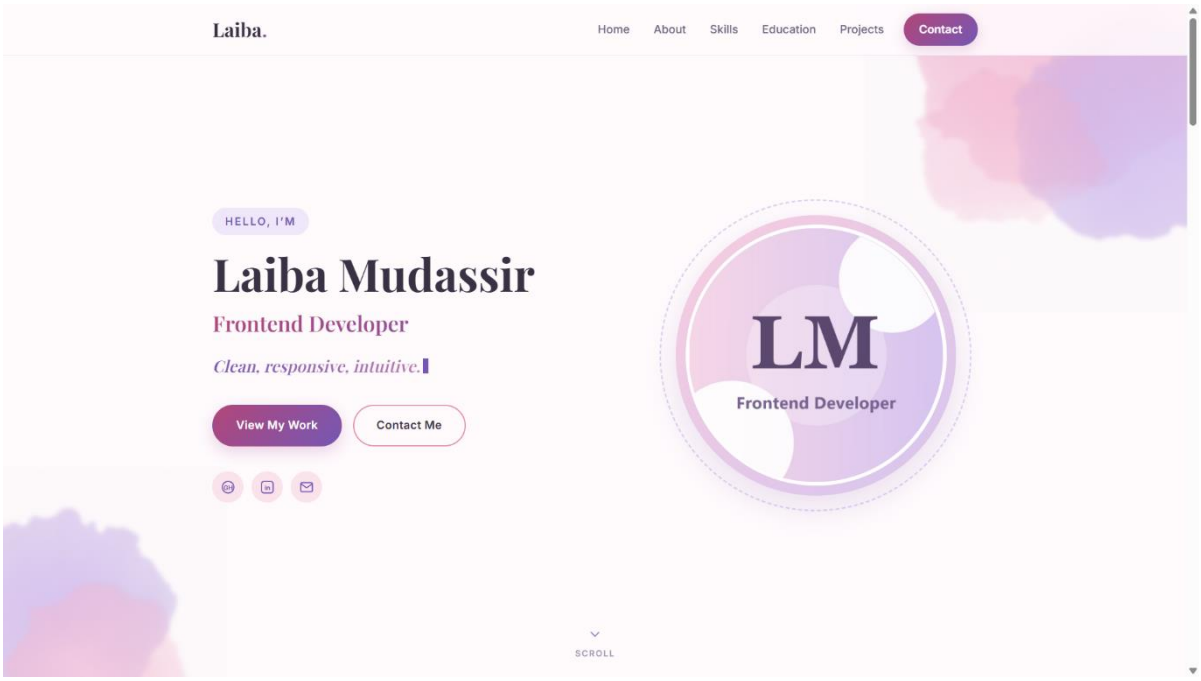

Style.css

9. Mobile Screenshots

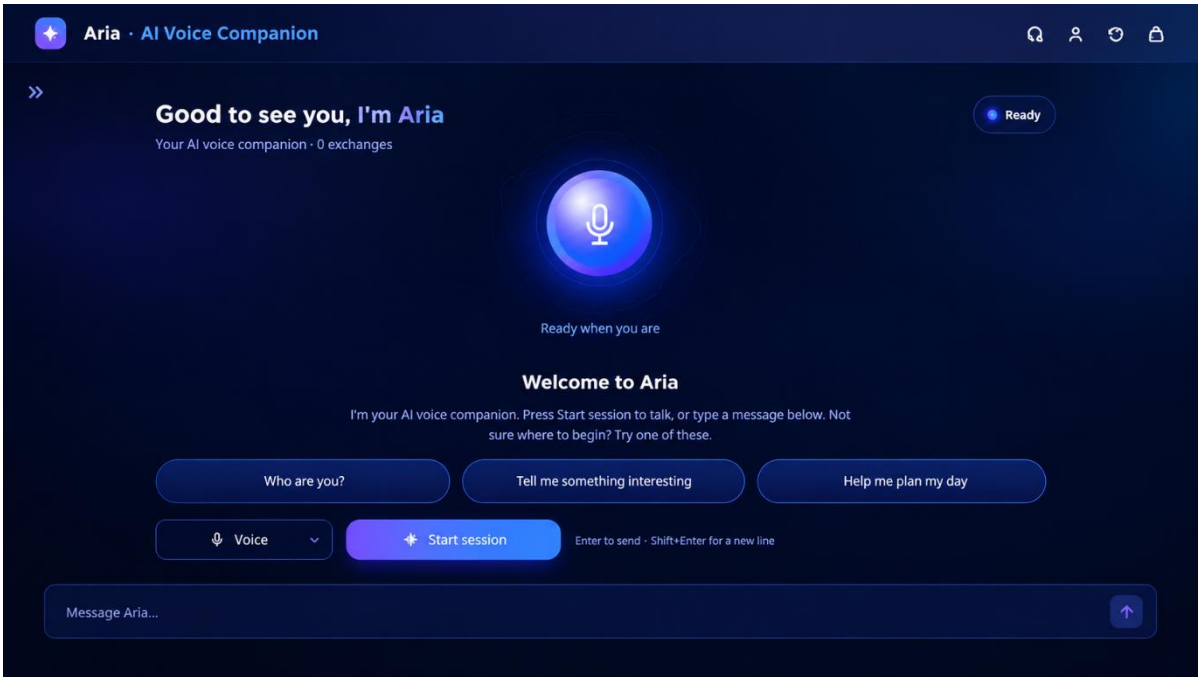

10. Project Screenshots

The Projects section showcases three real products. Each card is shown below with its interface screenshot.

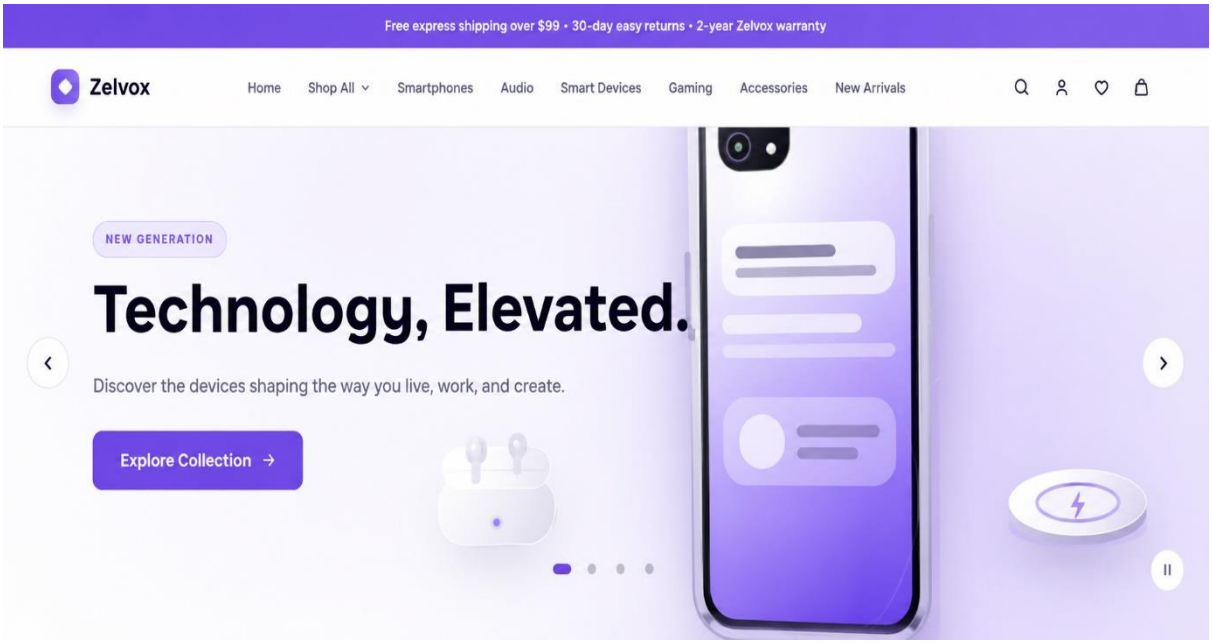

Project 1: Aria-AI Voice Assistant

A real-time AI voice assistant that listens, thinks and speaks back, pairing ElevenLabs speech (STT + TTS) with an OpenAI-compatible LLM in a polished Streamlit dashboard with an interruptible, full-duplex agent mode.

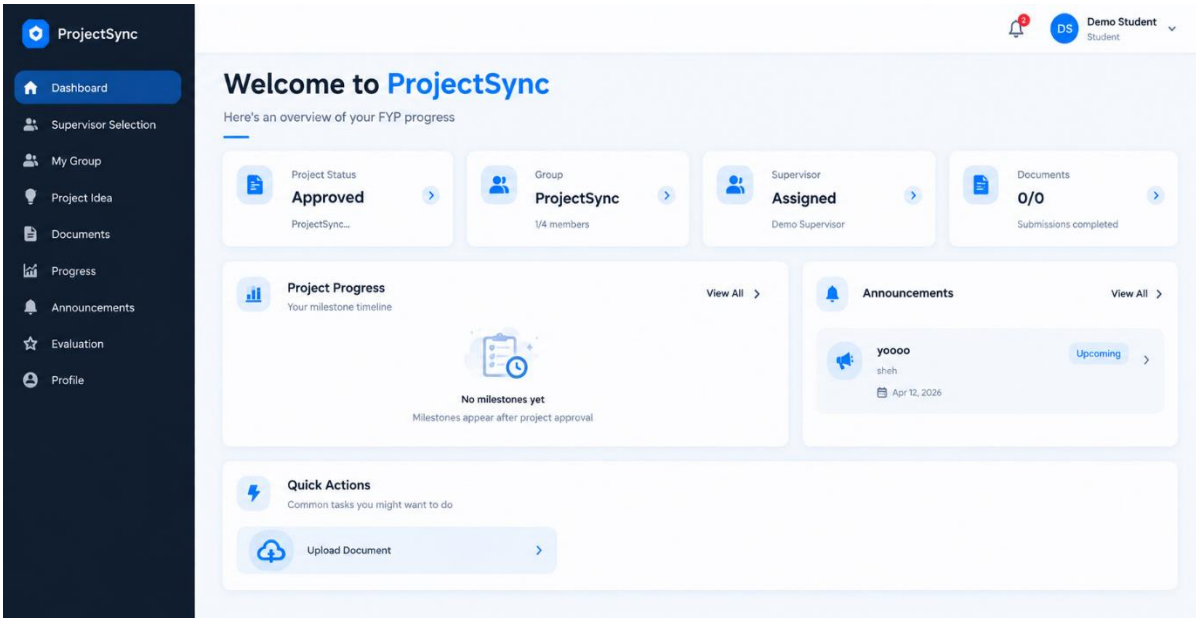

Project 2: Zelvox-Shopify Storefront Theme

A production-ready Shopify Online Store 2.0 theme for a premium gadget retailer, pairing a cinematic CSS-3D hero with a full commerce layer: quick add, cart drawer, variant picking, wishlist and predictive search.

Project 3: ProjectSync-FYP Portal

A web-based Final Year Project management platform built with React, TypeScript and Firebase, streamlining project submissions, supervision, progress tracking, evaluations and panel scheduling in one centralised, portable system.

11. Conclusion

This project resulted in a complete, professional personal portfolio website that presents my profile, skills, education, projects and contact details in a single polished experience. The soft watercolor identity, serif headings, gradient accents and subtle animations give the site a distinct personality while keeping content easy to read and navigate.

Building every layout, colour and animation with hand-written HTML5 and CSS3, without frameworks or templates, strengthened my understanding of semantic markup, the CSS box model, Flexbox and Grid, responsive design with media queries, and performance-friendly animation.

11.1 Future Improvements

- Connect the contact form to a backend or form service so messages can actually be sent.
- Add a downloadable resume and additional case-study pages for each project.
- Continue refining performance and accessibility with regular audits.
